 Adacel[®]

Tetanus Toxoid, Reduced Diphtheria Toxoid and Acellular Pertussis Vaccine Adsorbed

One shot. Big impact.

Pertussis could be a threat to your family's health

Pertussis, also known as whooping cough, is a highly contagious disease that causes severe coughing that can last for several weeks.¹

Complications of pertussis may include:¹

- Pneumonia
- Hospitalization
- Seizures
- Death

Even if you received vaccination against pertussis as a child, you may still be at risk

- Immunity to pertussis wears off 5 to 10 years following childhood vaccination²

You and your family could spread pertussis to your infant³

Studies show that when the source can be identified, family members are the source in up to 83% of cases transmitted to infants³

- International multicenter study of 91 families³
 - Source cases were identified for 44 infants and described by relationship to the infant, age, and household status³

Taking a few easy steps can help protect your family from pertussis

1. Make an appointment with your primary health-care professional to get vaccinated against pertussis
2. If you have children older than 11 years of age, talk to their health-care professional about vaccination as well
3. Encourage other family members and adults who have contact with your baby, such as babysitters, to get vaccinated

Vaccination is one of the best ways to help protect against pertussis.

Talk to your health-care professional about pertussis prevention with Adacel vaccine.

INDICATION

Adacel vaccine is given as a single dose to people 11 through 64 years of age to help prevent tetanus (lockjaw), diphtheria, and pertussis (whooping cough).

SAFETY INFORMATION

Side effects to Adacel vaccine include injection site pain, redness, and swelling; headache, body ache, tiredness, and fever. Other side effects may occur. Tell your doctor if you have ever experienced a severe brain disorder, such as encephalopathy (altered consciousness), Guillain-Barré syndrome (severe muscle weakness), or an Arthus-type reaction (severe, exaggerated swelling involving an injection site) after a previous dose of a tetanus toxoid- or pertussis-containing vaccine.

There is a small risk of allergic reactions. Some signs of allergic reactions are hives, swelling of the throat, low blood pressure, shock, and difficulty breathing. If you begin to experience any of these signs seek treatment right away. These reactions are rare and usually occur before leaving the doctor's office. If you notice any other problems or symptoms following vaccination, please contact your health-care professional promptly. The tip caps of the prefilled syringes may contain natural rubber latex, which may cause allergic reactions in latex sensitive individuals. Vaccination with Adacel vaccine may not protect all people receiving the vaccine.

For more information about Adacel vaccine, talk to your health-care professional and [click here](#) for Patient Information.
